~~Grounding and bonding as electrical installation protocols overlap to a certain extent, but they are not identical. In bonding, the emphasis is on creating low-impedance electrical connections between two or more conductive (metallic) bodies that are not normally current-carrying. These bonded objects are usually but not always grounded.~~

What you have to remember in this situation is that you're dealing with two separate issues. With respect to the grounding electrode, as specified in 250.30(A)(7), one electrode is adequate. With respect to bonding, you must do whatever section 250.104(D) instructs you to do — regardless of what you did with the electrodes as per 250.30(A)(7).

In Part 1: Grounding Versus Bonding, you will recall that we made a clear distinction between grounding, which is to provide a conductive path in the form of an equipment grounding conductor (EGC) for current to flow (to trip a circuit breaker or fuse) in the event of a ground fault condition. And bonding, which is to create continuity between ...

Additionally, under Chapter 7 Part 4.1.5, NFPA 77 notes that either insulated or uninsulated wires can be used for bonding and grounding but uninsulated wires are recommended because they allow for easier detection of defects. Insulated wires are those with a protective rubber or vinyl coating that completely encompasses the wire.
