Carrying forward the legacy of original author Terry Jordan-Bychkov, Mona Domosh and new coauthors Roderick Neumann and Patricia Price offer this thoroughly updated new edition of the acclaimed introduction to the cultural geography of the world today. The result is a text that maintains its original distinctive style while addressing contemporary issues and situations that students care about, most importantly, the continuing phenomenon of globalization. The Thematic Approach of The Human Mosaic The Human Mosaic introduces five themes in the opening chapter—culture region, cultural diffusion, cultural ecology, cultural interaction, and cultural landscape—then uses those themes as a framework for the topical chapters that follow. Each theme is applied to a variety of geographical topics: demography, agriculture, the city, religion, language, ethnicity, politics, industry, folk and popular culture. Through this organization, students are able to relate to the most important aspects of cultural geography at every point in the text.

The updated Student Study Guide provides a tremendous learning advantage for students using The Human Mosaic.

Physics owes much of its success to the application of differential calculus. Correspondingly, most laws of physics are formulated as differential equations. This success has created the prejudice that a science cannot be 'exact' unless

it stands firmly on a foundation of calculus. This doesn't, however, work for biology. Living things are not as continuous, let alone differentiable, as most organisms and their parts change or end quite abruptly. Biology cannot offer differential equations for (say) the role of chromosomal telomeres in aging, or a link between macrophage polyploidy and cancer. The information flow between the limbic system and the frontal cortex is far too erratic to permit differentiation. The pheromone secretions that control the social order of ants follow no mathematical laws. The topology of the human skeleton is neither a perfect sphere, nor an idealized doughnut. However, all these and countless other biological phenomena decide life and death and are amazingly exact. As such, instead of even trying to paint living things with the exquisitely resolving brush of differential calculus, we may accept that they are actually made up of individual and sizable 'pixels'. Hence, this book presents a novel view of biology as the unified science of 'living mosaics', which consist of discrete, yet interacting, 'tiles', which, in turn, are such 'mosaics' in their own rights.
