The brain constantly transmits signals whether during idle wakefulness (i.e., “at rest”) or different behavioral states like cognitively-demanding tasks. Studies using functional magnetic resonance imaging (fMRI) in humans have consistently observed neural networks of coherent activity within and between brain structures subserving some functional purpose or neuronal processing.

To the best of our knowledge, a neonatal rabbit brain atlas has not been published or made available. Its best approximation available in the literature, is the adult rabbit digital multi-atlas proposed by Muñoz-Moreno et al. (2013). This is based on 10 multi-modal scans acquired at 3 T with anisotropic resolution (0.15 mm, 0.15 mm, 0.7 mm) and it provides 60 anatomical regions, whose borders were identified by overlaying structural and diffusion weighted imaging (DWI) derived modalities.
