~~Railway Gate Control Electrical~~

Working of Automatic Railway Gate Controller.

In this circuit we have used ultrasonic sensors and servo motors to replicate the working of a railway crossing. Both the sensors are triggered with the help of trigger pins attached to Arduino board and distance is calculated. Further working of the circuit completely depends upon the distance measured.

By employing the automatic railway gate control at the level crossing the arrival of train is detected by the sensor placed on either side of the gate at about 5km from the level crossing. Once the arrival is sensed, the sensed signal is sent to the microcontroller and it checks for possible presence of vehicle between the gates, again using sensors.

provide safety to the road users by reducing the accidents. In the automatic railway gate control system, at the level crossing the arrival of the train is detected by the sensor placed near to the gate. Hence, the time for which it is closed is less compared to the manually operated gates and also reduces the human labour. II.
