The breeding plan given below is based on the description by Meyn and Wilkins (1974) whose schematic diagram is also reproduced in Figure 4.1. The herd consists of about 500 cows. Breeding is by AI with semen from the best two progeny tested bulls. Female selection is almost entirely on milk yield during the first two lactations.

~~breeding plans for ruminant livestock in the tropics~~

Recording for the purpose of national decision making should take into consideration the ecological zones in which livestock are kept, the farming system, whether nomadic, settled, smallholder or intensive, the role of crops in the farming system, the breed or breeds used and the problems of disease, adaptation and survival in each breed/production system combination.

~~breeding plans for ruminant livestock in the tropics~~

Lindhé (1978) describes a breeding plan which starts with the pure local breed and uses F 1 sires on these females. The female population will in a few generations approach 50 percent European blood. Hickman (1979) has a variant of this scheme which he calls the “repeated hybrid male cross”.

breeding plans for ruminant livestock in the tropics. The computations required to provide the information necessary in herd management are simple. In most instances, all that may be necessary is the individual unadjusted production data to aid in determining nutritional requirements and herd summaries. Data processing for genetic improvement, on the other hand, requires a considerable amount of computation.

breeding plans for ruminant livestock in the tropics. In general, livestock in tropical regions are less productive than those in temperate parts of the globe. They are smaller and have lower yields of milk, wool or meat. The question is: Is this difference inevitable because of the climatic differences, or can it be overcome by changing the animals or by changing the way they are cared for?
