In practice, it must be assumed that the "actual utilization" of a flexible manufacturing system will be less than its technical availability, since technical non-productive times are augmented by organizationally-induced non-productive times (organizational non-productive times), caused for example by unsatisfactory raw material logistics, NC programme corrections and on-the-spot NC optimization or cleaning work (cf. Fig.

Flexible Manufacturing System (FMS) Definition

Flexible Manufacturing System (FMS) — Ability of a system to respond to potential internal or external changes affecting its value delivery in a timely and cost-effective manner. Flexibility for an engineering system is the ease with which the system can respond to uncertainty in a manner to sustain or increase its value delivery. The first Flexible Manufacturing System named " System24 " was introduced in England in 1960.

Levels Of Flexibilities In Flexible Manufacturing Systems ...

A Flexible Manufacturing System (FMS) is a manufacturing system in which there is a certain degree of flexibility that allows the system to react in the case of changes, whether predicted or unpredicted. According to Maleki , flexibility is the speed at which a system can react to and accommodate change. To be considered flexible, the flexibility must exist during the entire life cycle of a product, from design to manufacturing to distribution.
